The European Pharmacopoeia is participating in the process of harmonization with the Japanese Pharmacopoeia and the US Pharmacopoeia as part of an informal. The pharmacopoeial classification is based on the criteria that ultimately led to the creation of pharmacological classifications. The main ones are: Almost all leading pharmacologists of the world agreed with the basic definitions of pharmacopathology and pharmacokinetics. Nevertheless, despite the significant and often mutually exclusive research results obtained from different regions of the world, confirmed statistically, it can be argued that the main goal of pharmacology is to help the doctor cure the disease (in this aspect, pharmacological classifications can be used as a guide). The nomenclature approach is the basis of the pharmacomeclide classification. It is used in the development of clinical guidelines. "Categories" differ only in the degree of scientific novelty. Accordingly, there are: The category includes medicines obtained by chemical synthesis both in finished form (for example, ACTH), and in the form of biologically active components extracted from the body (for example, norepinephrine) and injected into the body (for example, metoprolol). Treatment-and-prophylactic drugs include drugs intended for prophylactic (immunological, pathogenetic) treatment of patients in order to prevent complications, infectious diseases (for example, Naproxen, phenylephrine). The "dosage form" is defined by the content of the active substance (usually in the form of indirect solutions for subcutaneous and intravenous administration). The etiology, pathogenesis, morphology and clinic of pathologies and diseases in these forms are defined by the term "pharmacological group". The pharmacological group includes drugs used in various dosage forms for the treatment of various pathologies (otolaryngological, ophthalmic, gastrointestinal, etc.). The popularity of the pharmacological market is increasing all over the world, which, in turn, dictates the need to develop and publish pharmacosciences aimed at counteracting various undesirable consequences. According to the Organization for Economic Co-operation and Development, more than 90% of the funds received in the pharmaceutical industry are directed towards improving the effectiveness of treatment. At the same time, a significant percentage of experiments with the aim of developing new drugs, as well as independent clinical studies, indicate that research should be carried out not only under standard conditions, but also in significant changes
